Why do we have been seasons?

Earth's rotation

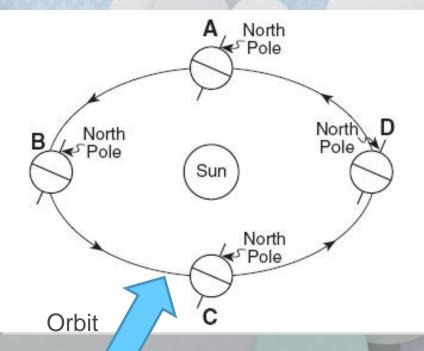

Axis

rotatio

- The Earth rotates on its axis (imaginary vertical line around which Earth spins) every <u>23</u> hours & <u>56</u> minutes.
- One day on Earth is one **rotation** of the Earth.
- One <u>Day</u> on Earth is when our side of the Earth faces the sun.
- Night on Earth is when the side of Earth we are on faces away from the sun.

Earth's revolution

It takes the Earth <u>365.25</u> days (or rotations) to travel or revolve around the Sun once.
This is called a <u>year</u>.

Motion Terminology

<u>Rotation</u> – to spin on an axis

Motion Terminology

 <u>Revolution</u> – the motion of a body around another body

Motion Terminology

 Orbit – the path that is followed around another body in space

Why do we have seasons?

Ellipse

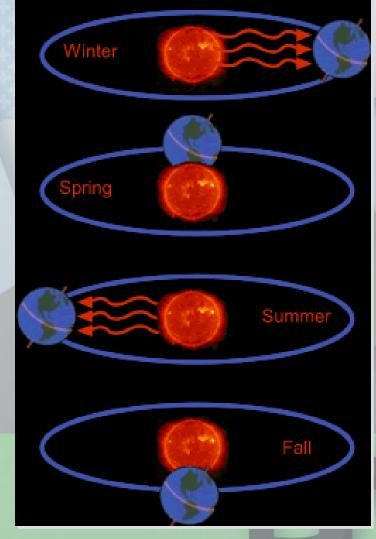

- The Earth's orbit around the sun is NOT a perfect circle. It is an <u>ellipse</u>.
- Seasons <u>ARE NOT</u> caused by how <u>close</u> the Earth is to the sun.
- In fact, the Earth is <u>closest</u> to the sun around January 3 and <u>farthest</u> away from the sun around July 4.

Why do we have seasons?

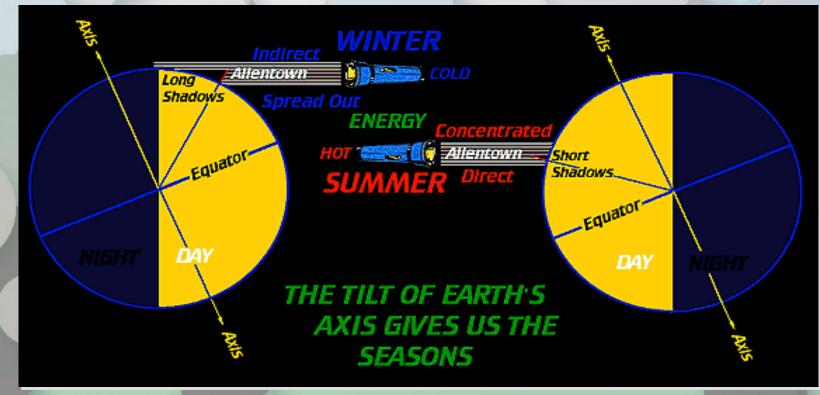

- Seasons are the result of the <u>tilt</u> of the Earth's axis.
- Earth's axis is tilted <u>23.5°.</u>
- This tilting is why we have <u>SEASONS</u> like fall, winter, spring, summer.
- The number of daylight hours is greater for the hemisphere, or half of Earth, that is tilted toward the Sun.

<u>Seasons Interactive</u>

Northern Hemisphere Seasons:

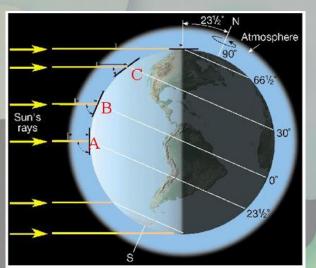

Why do we have seasons?
Summer is warmer than winter (in each hemisphere) because the Sun's rays hit the Earth at a more <u>direct</u> angle during summer than during winter

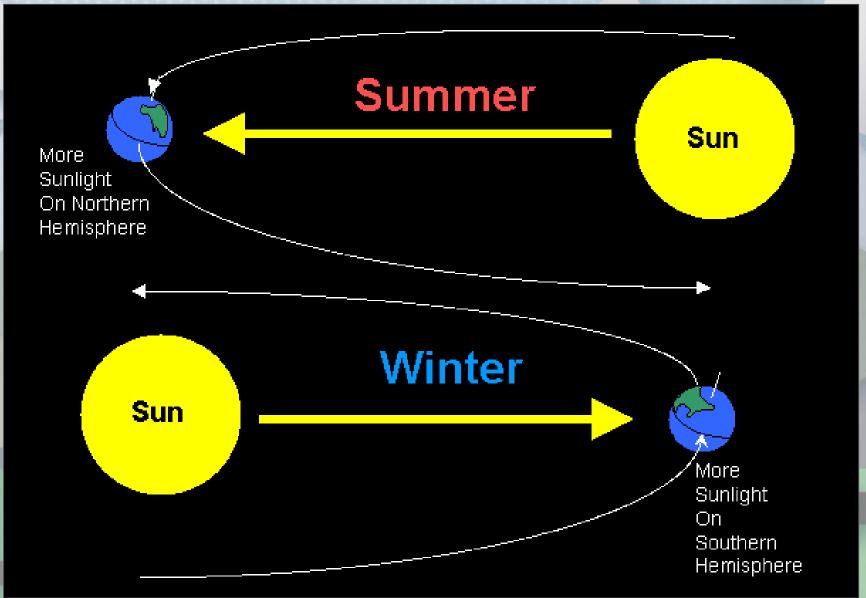

Why do we have seasons?

- Also the days are much <u>longer</u> than the nights during the <u>summer</u>.
- During the winter, the Sun's rays hit the Earth at an <u>extreme angle</u>, and the days are very short. These effects are due to the tilt of the Earth's <u>axis</u>.

Seasons...in a nut shell

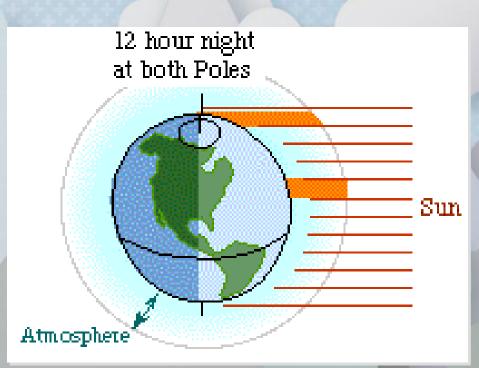

Solstices

- Occur twice a year, when the tilt of the Earth's axis is oriented at its extremes. <u>Tilted the farthest or closest</u>
- Winter solstice is the shortest day of the year. In the Northern Hemisphere. It occurs on <u>December 21 or 22</u> and marks the beginning of winter.
- The Summer Solstice is the longest day of the year. It occurs on <u>June 20 or 21</u> and marks the beginning of summer.

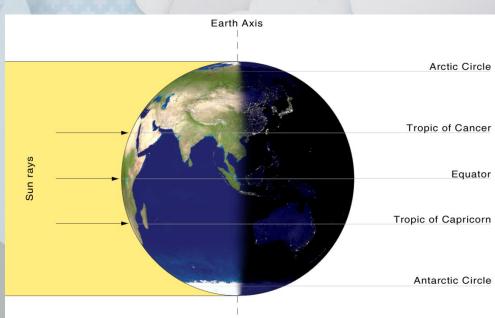

Equinoxes

- A day lasts <u>12</u> hours and a night lasts <u>12</u> hours at all latitudes.
- Equinox literally means "equal night".
- Sunlight strikes the earth most directly at the equator.
- This occurs <u>twice</u> a year.

Equinox

- The vernal (spring) equinox occurs March 20.
- The autumnal (fall) equinox occurs September 22 or 23.

Tropic of Cancer / Capricorn
 The point where the Sun is right overhead at noon during a solstice.

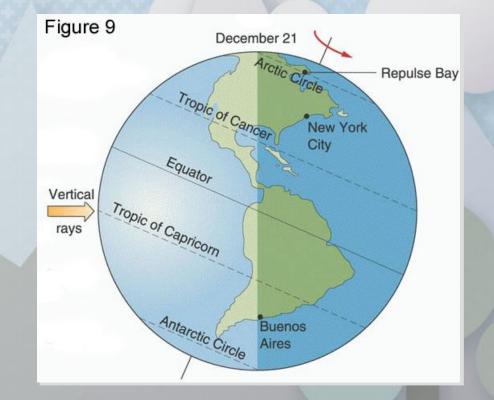

Tropic of Cancer

EQUATOR

Tropic of Capricorn

Arctic circle / Antarctic circle

 The point where the Sun is just below the horizon during a solstice / The point where the Sun is always visible during the opposing solstice.

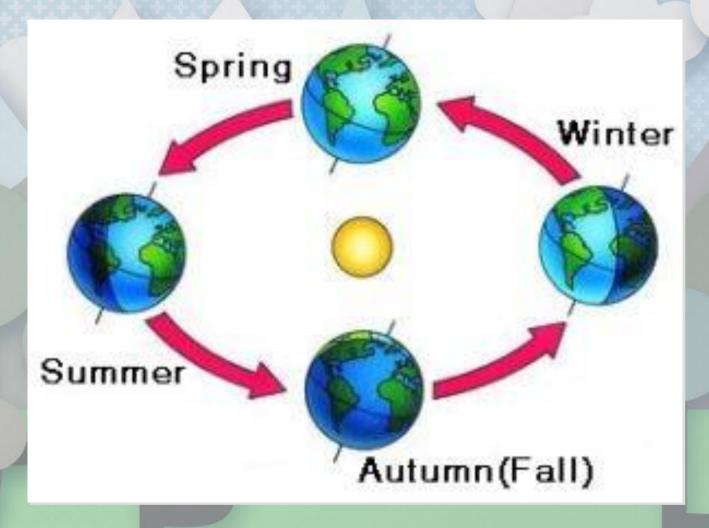

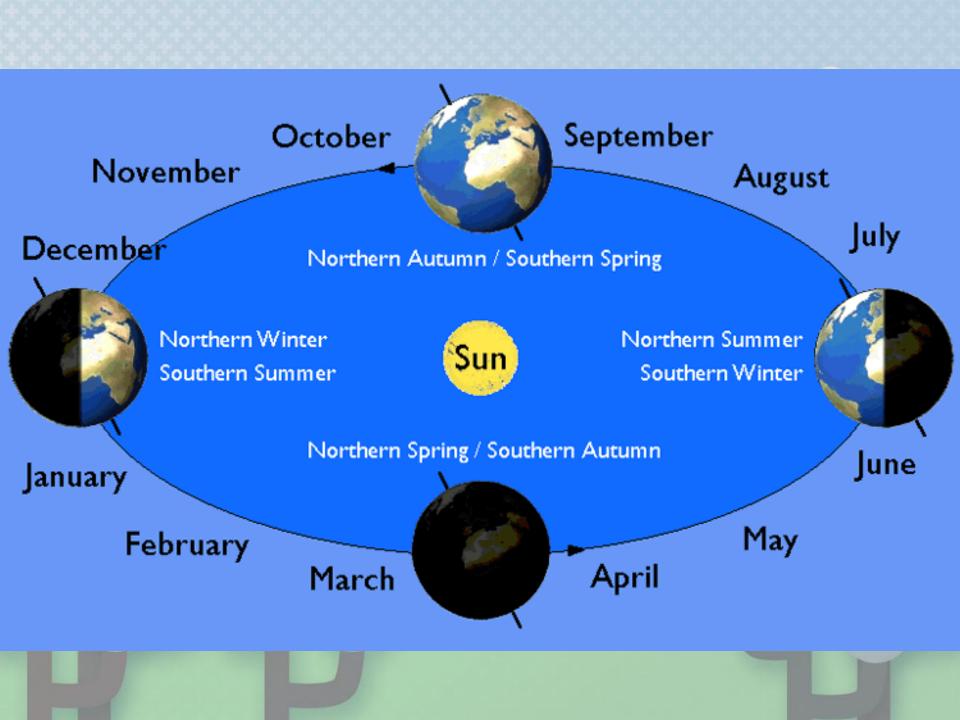

The Earth's seasons <u>ARE NOT</u> caused by the differences in the distance from the Sun throughout the year.

BIG SCIENCE

DEA

Review Look closely at where the Sun is hitting the Earth during each season:
